### **NAME**

### **LIBRARY**

Streaming Archive Library (libarchive, -larchive)

#### **SYNOPSIS**

### DESCRIPTION

## archive\_read\_extract(), archive\_read\_extract\_set\_skip\_file()

A convenience function that wraps the corresponding archive\_write\_disk(3) interfaces. The first call to **archive\_read\_extract**() creates a restore object using archive\_write\_disk\_new(3) and archive\_write\_disk\_set\_standard\_lookup(3), then transparently invokes archive\_write\_disk\_set\_options(3), archive\_write\_header(3), archive\_write\_data(3), and archive\_write\_finish\_entry(3) to create the entry on disk and copy data into it. The *flags* argument is passed unmodified to archive\_write\_disk\_set\_options(3).

# archive\_read\_extract2()

This is another version of **archive\_read\_extract**() that allows you to provide your own restore object. In particular, this allows you to override the standard lookup functions using archive\_write\_disk\_set\_group\_lookup(3), and archive\_write\_disk\_set\_user\_lookup(3). Note that **archive\_read\_extract2**() does not accept a *flags* argument; you should use **archive\_write\_disk\_set\_options**() to set the restore options yourself.

# archive\_read\_extract\_set\_progress\_callback()

Sets a pointer to a user-defined callback that can be used for updating progress displays during extraction. The progress function will be invoked during the extraction of large regular files. The progress function will be invoked with the pointer provided to this call. Generally, the data pointed to should include a reference to the archive object and the archive\_entry object so that various statistics can be retrieved for the progress display.

## **RETURN VALUES**

Most functions return zero on success, non-zero on error. The possible return codes include: **ARCHIVE\_OK** (the operation succeeded), **ARCHIVE\_WARN** (the operation succeeded but a non-critical error was encountered), **ARCHIVE\_EOF** (end-of-archive was encountered), **ARCHIVE\_RETRY** (the operation failed but can be retried), and **ARCHIVE\_FATAL** (there was a fatal error; the archive should be closed immediately).

## **ERRORS**

Detailed error codes and textual descriptions are available from the archive\_errno() and archive\_error\_string() functions.
